

Section 1 – Sprint Goal

Write ONE clear, demonstrable Sprint Goal.

It must:

- Be specific
- Be measurable
- Be demonstrable
- Add value toward the Product Goal

Sprint Goal:

A user will be able to navigate the website using the navigation bar and successfully access each page's barebones templates without encountering errors.

How will you demonstrate this goal at Sprint Review:

During the Sprint Review, stakeholders will be provided with a live demonstration of the developed website (and will be allowed to interact with the website themselves). The demonstration will be conducted following a test sequence that confirms whether the Sprint Goal has been achieved:

- The presenter will display the home page on a browser, ensuring that the navigation bar is visible and correctly formatted.
- Each of the links on the navigation bar will be clicked individually, such as "Home," "About," "Features," "Contact," etc., while the audience will be able to observe how the browser loads the corresponding page.
- For each of the pages, the presenter will ensure that:
 - The navigation bar is visible on the webpage.
 - The URL corresponds with the route for that webpage.
 - The page template loads completely without any console errors, broken links, or missing components.
- Finally, the same navigation test will be performed again on another browser window or incognito window.

Finally, the achievement of the Sprint Goal will be determined by 100% of the links on the navigation bar correctly routing to their corresponding pages, while the page templates load correctly without any errors during the live demonstration. Stakeholders will then be able to perform their own "navigation test" on the website.

Section 2 – Selected Product Backlog Items

List the backlog items select for Sprint 1.

These must:

- Be small enough to complete in one Sprint
- Be demonstrable
- Move the product toward MVP
- For each item specify if it's size – S/M/L

Item 1: Create a navigation bar thats demonstrable over mobile and desktop applications. This is a size S item (though it can be complicated to be a size L issue).

Item 2: Create a landing page for our website. The item size is M because it requires us to have a functioning framework.

Item 3: Create a basic template for each page. The item size is S because it's only a basic template for each page.

(List additional items if realistic)

Why is this amount of work realistic?

This amount of work is realistic because it sets up the baseline work for us to continue. The size of all these tasks is also relatively small, hence; this work period shouldn't be too complex. The original feedback we got was that our plan was too complex with the risk of overcomplicating information. Hence, we decided to boil down each work period to its base necessities. By only promising the MVP for each backlog item, we allow the team more flexibility to complete additional work done. Each one of these backlog items is also demonstrable and small enough to finish over a few days.

Section 3 – Task Breakdown

Break each backlog item into tasks.

Tasks must:

- Be 1 day or less
- Be assignable
- Be concrete

Backlog Item 1 (Nav Bar) Tasks:

- “Hoverables”: Make it so that the nav bar is a hover able so that user can interact with it using a mouse. This just further adds to user aesthetics.
- Add nav bars to a computer platform. As websites tend to look different on mobile and computers, making sure that the nav bar scales accordingly is important.
- Adding a nav bar to a mobile platform. Reacting will make the process simpler.

Backlog Item 2 (Landing Page) Tasks:

- Connect routing and links. Connect the landing page to the nav bar and all other buttons and interactable. Reduce code redundancy by finding shared components (such as in buttons).
- Set up a landing page file. Create the landing page component within the framework with basic sections completed.
- Style the landing page with different fonts, button shapes, colors, and small placeholder graphics for future sprint components.

Backlog Item 3 (Basic template for each page) Tasks:

- Create the base template component. Build a single template that can be used across all pages including content slides and a nav bar.
- Apply the template to each page by wrapping each page to the base template.
- Add footholder placements so every page has a consistant top and bottom structure. Done when all nav and footers appear without duplicate code.

Project 3 – Sprint 1 Planning Document

Section 4 – Ownership and Accountability

Each task must have a primary owner:

Owner assignments:

Task	Owner
“Hoverables”	Sath
Navigation Bar: Computer Platform	Yohaán
Navigation Bar: Mobile Platform	Aarush
Connecting Routing and Links	Sriram
Set Up Landing Page File	Sath
Styling of Landing Page	Aarush
Base Template Component	Yohaán
Apply Template to Each Page	Sriram
Footholder Placements	Sath

All members must have development tasks.

Who will be your Scrum Master for this Sprint?

Yohaán will be the Scrum Master

Project 3 – Sprint 1 Planning Document

Section 5 – Definition of Done Confirmation

Confirm:

- Does every selected item meet Definition of Done before more to Done? **Yes**
- Is peer review required? **Yes**
- Is demonstration required? **Yes**

Team agreement:

We agree that no item will be considered complete unless it meets the Definition of Done.

Signatures:

Sriram Marasanapalle

Yohaán Ardeni

Sathkrith Segu

Aarush Kapoor

Section 6 – Risk Check

What could cause this Sprint to fail?

- Risk 1: Routing Errors.
 - Incorrect routing configuration may prevent navigation bar links from loading the correct pages or could potentially cause broken links.
- Mitigation:
 - Routing should be tested early in development and after each routing change. Routing structure should remain consistent and there should be manual navigation tests for each link before integrating with others. Developers should also consistently check the browser console and terminal for errors during testing.
- Risk 2: Responsive design issues
 - It may be difficult to get a functional, responsive design that is seamless between different screen sizes and odd aspect ratios, causing potential usability problems on mobile or desktop.
- Mitigation:
 - Develop the navigation bar using responsive design elements such as flexible layouts and media queries. Throughout the design process, the navigation bar should be tested on multiple aspect ratios, especially that of mobile and desktop displays. The navigation bar should also be adjusted in a portrait display to be hidden behind a sandwich icon, enabling a smoother interface and less clutter on the screen, whereas it would be fully visible on a larger, horizontal display.
