

Sprint 5 – Demo Readiness Checklist

This document verifies that your system is fully prepared for a live, stable demonstration. Incomplete or inaccurate checklists will have an impact your evaluation.

Sprint Goal & Demo Plan

Sprint Goal (exact wording you will say during demo):

By the end of Sprint 5, a user will be able to view and filter available bike trails by difficulty and surface type; see the money savings of choosing to bike over other transportation modes; and log rides to their activity log with a correctly stored date and no ability to log rides in the future.

Demo Workflow (1–2 sentence description of what the user will do):

The user will navigate to the Trails Page and apply difficulty and surface type filters to render matching trail cards, then click a card to open the detail modal; from there, the user will visit the calculator page, where they will input a distance and a transportation mode to see a real-time cost and CO₂ savings comparison. Finally, the user will head to the Activity Log Page and submit a new ride entry through the "Add Ride" button, where future dates are greyed out and blocked by front-end date validation (the logged ride should then correctly populate in the activity table).

Full Demo Sequence (Step-by-Step – must be specific and numbered)

List each user action and system response in order. Add additional rows as necessary. This sequence must match exactly what is shown during the live demo.

Step Number	User Action	System Response
1	Navigates to Trails Page and selects a difficulty level and surface type from the filter dropdowns	The trail card list will dynamically update to display only trails that match the selected filters
2	Clicks on a Trail Card	A detail modal will open up, displaying the trail's name, difficulty, surface type, and additional info.
3	Navigates to Calculator Page, enters a random distance, and select "Car" as the transportation method	The App will display a calculated cost savings.
4	Navigates to Activity Log Page, clicks "Add Ride", and attempts to select a future date	Future dates are greyed out and blocked, preventing selection of future dates
5	Logs an Activity with a valid date and clicks Submit/Enter	A new ride entry will appear correctly in the activity log table with the proper date stored

Demo Validation – Check all that apply based on your completed pre-demo rehearsal (must be done before submission)

Sprint 5 – Demo Readiness Checklist

- ☒ Full demo flow completed start → finish without errors
- ☒ Demo completed at least twice successfully
- ☒ Tested with different input OR variation in user behavior
- ☒ Confirmed the demo works without restarting, refreshing, or resetting state mid-flow

What is your highest risk failure point? What would happen during the demo if this failed?

The filter logic returning incorrect or unfiltered trail cards from our placeholder data, which would make the difficulty and surface type filters appear broken or unreliable to the live audience.

How this was tested:

We manually applied filter combinations against the hardcoded placeholder trail data and verified that only the correct cards were displayed for each selection.

Result of test:

Filters returned the expected trail cards consistently across all combinations that we tested, which confirmed that the logic worked correctly with our current placeholder data ahead of the future actual trail integration.

Stability Proof – Choose one or both of the following and then describe exactly what I should see in your demo (must be clearly visible without explanation).

- ☐ We will repeat a key action live
- ☒ We will show variation (different input or path)

Describe what will be repeated or varied and when in the demo this will occur:

We will run the Calculator twice with two different inputs (once with 10 Miles and Car Selected, and then clearing and entering 5 Miles with Transit Selected) to show that the cost savings and CO2 comparison values will update correctly each time based on the new distance and transportation mode.

Demo Roles

Demo Lead: [Yohaán Ardeni](#)

Secondary Support: [Aarush Kapoor](#)

- ☒ Demo Lead has run the full demo at least once before class
- ☒ Secondary Support understands all demonstrated functionality and work done during this Sprint well enough to handle Q&A without needing clarification from the Demo Lead.

Sprint 5 – Demo Readiness Checklist

Demo Environment Readiness – Checking these boxes acknowledges that you have done necessary pre-demo prep work before leaving class on Thursday or Friday morning during office hours.

- ☒ Device(s) are ready
- ☒ Release branch is synced to computer(s) that will be used during demo and application runs correctly from that branch.
- ☒ System has been tested on the actual device that will be used during the demo.
- ☒ Logins/accounts are prepared including information that may be required to show new account creation.
- ☒ No setup is required during demo

Screen Discipline

During the demo and Q&A you may **NOT** display:

- planning documents
- notes or scripts
- any non-product materials

- ☒ We understand that only the product and related dialogs should be visible on the Smart Board during the demo
- ☒ We understand that if non-product materials are shown during the demo, it will be treated as a lack of preparation.

Final Certification - Each team member is accountable for the accuracy of this document.

- ☒ This demo can be executed **start → finish** without explanation, retries, or fixes
